

- Communication

- Email
- Discord
- WhatsApp
- Teams

These services are to help you communicate with people, including messages, and resources. Businesses use some of these services to easily communicate or share resources amongst their staff. I would use them to talk to friends or family easily, as these services are also free to use. Some of the benefits you may have, is that some are free to use, easy to group many people together to make sure everyone knows what happening. Some of the platforms have limitations, such as email you can't send large files easily, some platforms may lock features behind paywalls, such as larger files, longer messages, bigger groups, etc.

- Real time information

- FlightRadar24
- BBC News
- Yahoo Finance
- Open Weather API

These services give you live data regarding news, flights, finance and weather. Businesses could use some of these to track how they're doing stock wise and keep up to date with the news. I could use some to track important details about the flights I'm going to catch. The benefits of these are keeping up to date as possible, being able to adapt fast, and being prepared. The limitations are that some of these services are paid, not paying could limit the features you

need and some you need a good internet connection to have reliable real time information.

- Commerce
 - Amazon
 - eBay
 - Shopify
 - Etsy

These services allow you to buy products from businesses and people who make their own products to sell. Businesses could use these services to get custom made products, hard to find products, or just have simple delivery. I could use it to find products that are harder to find in person, so I could just search for what I want, buy it and have it shipped to me. Some of the benefits could be that most of the time you get some warranty with the products, and you can find almost anything you want, instead of waiting to find one in person. Some of the limitations are that products can get lost in delivery or you could be scammed.

- Government
 - Applying for import licenses
 - Cancelling lost or stolen passports
 - Apprenticeship assessment service
 - Find and update company information

These services would be essential for some businesses that do lots of importing and exporting products. Some businesses would use the import licenses to allow them to import

restricted products into the country, and updating the company information could be needed if they were to rebrand or relocate. I could use the cancelling a passport option if I was to lose or have it stolen. The benefits of using these services are making sure that everything is up to date for the public and making sure you are following the laws. The main limitation could be that you might be rejected from some of these services if done incorrectly or you don't fit the criteria.

- Education
 - Bitesize
 - Twinkl
 - Oak National Academy
 - National Geographic

These websites serve the user educational content of many varieties, mainly ranging from reception and above. Businesses might use them to train new employees or people on apprenticeships to give them a more easy and simple way to learn. I could use them to do similar, like learn new things about a certain topic. Most of the services are free, and if they aren't the free content is still very good and useful and would mean businesses wouldn't have to pay out large sums for teaching small groups of people. Sometimes the information may be too simple for the target audience or may not have the topic you are looking for as it could be targeted at school students.

- Virtual Learning Environments
 - Zoom
 - Teams
 - Google Classroom

- Moodle

These environments are used to help teach students in multiple ways, via sharing work, or on some platforms having online meetings. Businesses could use them to help share files and information across the workplace or teach apprentices. I'd use them to talk with peers about the work and upload mine to the correct place. It keeps all the work and meetings all in one place and can be very easy to setup. The limitations are that most of these services are limited without payment, and without paying for them you would be limited in what you could do.

- Entertainment

- Netflix
- YouTube
- Prime Video
- Disney+

These services are used to entertain the viewer or provide educational content to watch, or in YouTubes cases upload content. Businesses could use it to display educational content or upload videos for the public to watch. I'd use them to watch general entertaining videos and maybe some education content. The benefits of using them are to keep the viewer entertained or better teach some viewers than they would through written form, and it's an easy way to display your content to the public. If you were using these platforms for business purposes only there is a lot of content that's not suitable for the workplace, which can't be hidden, and almost all these services require a subscription.

- Business
 - Trello
 - ClickUp
 - Notion
 - Jira

These services allow for businesses to track and work on new things within their business. Businesses could use these tools to track where they are in development of something, track problems, or note things down for others. I could use some of these services/tools to help see what I've completed and need to work on in my own personal projects. Some benefits are it's much easier to understand what needs to be done, what needs fixing, or just to get a general note across. Some of the features are blocked behind paywalls and or require enterprise plans.

- Download services
 - Dropbox
 - Google Drive
 - MEGA
 - Mediafire

These download services give you your own storage space that's easily sharable to other people or the public, allowing you to share files or folders without you having to send all of them through a limited messaging service. Businesses could use them to share files to the public easily without it putting load on their servers or if they don't have any. I would use it to share big videos or photos that I can't send over messaging apps. The benefits of using these are the file size limits are much bigger, and it can be accessed anywhere, sometimes not requiring a login if you've made it public. There are limitations to them, the storage space is limited for free usage, which can vary from service to service, and some platforms won't allow you to upload certain files in the possibility of it being malicious.
